DESIGN. BUILD. TEST ▶ LAUNCH

ENERGISING THE FUTURE, **REINVENTED.**

Energizing the Future – Reinvented

Why this Hackathon matters: Company relevance & local ecosystem impact

This is not a hackathon about EV chargers.. It is a declaration of intent that our organisation will lead the island's transition to intelligent, data-driven, sustainable energy management, beginning with the most visible and immediate challenge in our own workplace. The EV charger is the lens. A sustainable digital future is the vision.

The Moment in Time

We are at an inflection point. The convergence of three forces : accelerating EV adoption, tightening government regulation, and the maturity of AI ; creates a narrow window of opportunity. Organisations that act now will shape the standards others must follow. Those that wait will be shaped by them.

+40%

EV registrations on the island, year-on-year

2026

Year government EV energy targets take effect

3x+

Energy systems addressable with the same AI platform

100%

Of outcomes traceable to ESG and net-zero commitments

The island's government is not waiting. Binding targets for EV charger energy consumption are already in motion, carrying compliance obligations, audit requirements, and potential restrictions on future charger deployments for non-compliant organisations. This is not a risk to be managed, it is an opportunity to be seized.

The Broader Vision: Beyond the Charger

Every organisation is becoming an energy manager, whether it chooses to or not. The proliferation of electric vehicles, the digitalisation of physical workplaces, and the tightening of government regulation mean that energy is no longer a utility bill - it is a data problem, an AI problem, and increasingly, a reputational problem.

Organisations that treat energy as a data challenge will be more efficient, more compliant, and more attractive to talent and clients. Those that do not will find themselves managing an analogue problem in a digital world, on a timeline set by regulators rather than their own ambitions. The architecture built during this Hackathon - the data pipeline, the AI regulation engine, the fairness logic, the extensibility framework - is the foundation of an intelligent energy platform that will serve the organisation and the island for years beyond the event itself.

This Hackathon is the organisation's statement that it will lead rather than follow. The EV charger is the starting gun, not the finish line.

Abbreviations and Glossary

Item	Description
EV	Electric Vehicle
OCPP Protocol	Open Charge Point Protocol
Power Apps	Microsoft low-code application platform
Borne	EV charging station

Why It Matters: The Island Ecosystem

A single organisation building a smart EV charging system has operational value. The same organisation openly demonstrating that system, sharing its architecture, and influencing regulatory thinking has transformational value - for the island, its energy grid, and its ambition to be a sustainable digital economy.

The purpose of this Business Requirements Document (BRD) is to define the business needs, objectives, and high-level requirements for the implementation of an application.

This document serves as a reference for stakeholders to understand the business problem, proposed solution, and expected outcomes.

Context

his initiative sits at the intersection of four forces that will define competitive relevance in the decade ahead: artificial intelligence, sustainability regulation, talent engagement, and energy economics. The Hackathon is an investment in all four simultaneously.

The question is not whether the organisation needs an intelligent energy management capability. It does - and the regulatory timeline confirms it. The question is whether we build that capability on our terms, generating IP and competitive advantage in the process, or whether we procure it from vendors at a premium, on their terms, after the window has closed.

We choose to build. We choose to lead. We choose to reinvent the way we energize the future.

Currently, EV charging stations are available at two company locations, NEX Tower and NEXTERACOM. However, there is no formal reservation system in place. Access is managed manually by workplace and security teams, with a usage limit of up to three hours or until the vehicle reaches a sufficient charge. Tracking is also handled manually, and there are no official reporting capabilities.

This project aims to implement a controlled, transparent, and equitable application that streamlines access, improves tracking, and enables reporting.

Problem Statement

The organization currently lacks a structured system to manage EV charging stations, limiting its ability to ensure fair and efficient usage. The absence of a formal reservation process, defined usage controls, and consumption monitoring creates operational and visibility challenges.

Key Issues

This lack of a centralized charging management system results in:

- Inequitable use of EV charging stations among employees
- Limited visibility into real-time charger availability
- Extended or unmanaged charging sessions by individual users
- No tracking or monitoring of energy consumption
- Inability to generate usage insights or sustainability reports

Impact

These challenges reduce overall efficiency, hinder fair access, and limit the organization's ability to optimize resources and support sustainability goals.

Business Objectives

1	Ensure equitable access to EV chargers
2	Provide real-time visibility of charger availability
3	Limit charging duration to one hour per user per day
4	Track EV charger usage and energy consumption
5	Enable reporting and analytics
6	Support sustainability and governance initiatives
7	Ensure users are reminded to attend their charging sessions
8	Ensure chargers are freed promptly after session completion

Expected Benefits

The implementation of the Application will:

- Improve charger utilization fairness
- Reduce missed or unattended charging sessions
- Ensure chargers are freed on time for other users
- Encourage responsible usage through timely notifications
- Maximize availability of charging stations
- Improve overall user compliance and satisfaction
- Provide accurate energy consumption insights
- Support data-driven sustainability reporting

Stakeholders

1	Accenture Mauritius
2	Workplace Team
3	Security Team

High level business process

The high-level business process includes:

1. User authentication on the Web Application
2. Viewing EV charger availability
3. Booking an available charging slot
4. Charging session execution
5. Consumption data capture via OCPP
6. User receives reminder before session
7. User receives notification at session end
8. User frees slot or vehicle
9. Reporting and monitoring

As-Is process - Back office

- Booking requests are handled manually without a formal reservation system
- Charger allocation is managed by workplace and security teams
- No structured controls to consistently ensure fair and efficient usage
- Maximum of 3hr charge is requested by workplace team
- No monitoring or tracking of energy consumption
- No capability to generate usage data or sustainability reports

As-Is process – Charger Usage

- Users request and secure charging slots through a manual process
- Charger availability is not transparently visible to all users
- Charging sessions are inconsistently regulated, leading to extended or unmanaged usage
- Inequitable access may occur due to limited visibility and lack of standardized controls

As-Is process – Booking Register

Requirements

#	DETAILS
BR001	The web application should have a user and an administrator interface.
BR002	Enforce a maximum charging time of one hour per user per day.
BR003	Show real-time charger availability by site/location and by time slot.
BR004	Integrate with virtual chargers using OCPP to retrieve charging session, energy consumption data and create contactless authentications (OCPP handshake using EID (Workplace registry), Parking Slot and Badge)
BR005	Record usage of charging facilities and energy consumption for every user, make and model of car.
BR006	Maintain and manage a database of EV users eligible to book chargers.
BR007	Provide a user-friendly reservation for EV chargers across two sites.
BR008	Send reminder notifications to users before their charging session starts.
BR009	Send notifications to users when their charging session ends, prompting them to collect their vehicle.
BR010	Allow administrators to configure booking rules (e.g., slot duration, booking window, and per-user booking limits).
BR011	Allow administrators to create, modify, and cancel bookings (including on behalf of users) and to block chargers/time slots for maintenance or special use.
BR012	Implement role-based access control so only authorized users can administer settings and access reports; standard users can only manage their own bookings.
BR013	Privacy acknowledgement and charging data (e.g., what personal data is stored, and who can access it).

Exclusions

The following needs are excluded from the current project and can be addressed in future iterations.

- Installation of additional charging stations
- Hardware maintenance of chargers
- Smart queuing system (automatic booking reallocation)
- Native mobile application

Assumptions

The following assumption needs to be taken into consideration during the project:

#	ASSUMPTION
AS01	OCPP endpoints and credentials are available
AS02	EV user data already exists and can be integrated
AS03	Testing will be done using a simulator
AS04	BI tools may be used for reporting
AS05	Use only Accenture authorized AI tools with Accenture provided license/subscription (Claude, GitHub Copilot, MS Copilot, Gemini and Amethyst)
AS06	Team must manage usage of AI credits

Dependencies

- Access to virtual OCPP charging stations will be provided.

Conclusion

This Discovery phase has validated the opportunity to design a modern, scalable EV charging reservation and monitoring solution that not only improves access and operational visibility but also creates a strong foundation for innovation. Beyond reservation management and energy consumption tracking, the integration of AI in solutioning opens the door to smarter demand forecasting, usage pattern detection, intelligent reporting, and ongoing optimization of charger utilization. With the right governance and responsible AI practices in place, this initiative can evolve into a forwardlooking reference model that supports sustainability, operational excellence, and digital transformation across organizations facing similar challenges.

This BRD sets the stage for the elaboration phase and the detailed design of that future-ready solution.
